CLASS DIAGRAM

Aim

To design and study the Class Diagram of the Online Resume Builder System using UML concepts in order to represent the relationship between different system components involved in resume creation, editing, template management, and PDF generation.

Class Diagram

- The class diagram of the Online Resume Builder System illustrates the static structure of the application and shows how different classes interact with each other to create professional resumes. The system begins with the **User** class, where users can register, log in, and manage their resume details. The user information is securely stored and validated within the system.
- The entered details are managed by the **Resume** class, which stores information such as resume ID, resume title, creation date, and modification date. This class also handles resume editing and updating functionalities.
- The **Personal Details** class contains user information such as name, email, phone number, address, and social media links. This information is displayed in the resume header section.
- The **Education Details** class stores academic qualifications including degree, institution name, percentage or CGPA, and passing year. This class helps organize educational information systematically in the resume.
- The **Skills** class maintains technical and non-technical skills added by the user. It allows users to include programming languages, tools, frameworks, and soft skills in the resume.
- The **Projects and Experience** class manages project details, internships, and work experiences. It stores project title, description, technologies used, company name, and duration.
- The **Template Manager** class provides multiple resume templates and formatting styles. Users can select templates according to their preferences for generating professional resumes.
- The **PDF Generator** class converts the completed resume into downloadable PDF format. It ensures proper formatting, alignment, and printable layout generation.
- Finally, the generated resume is displayed through the **Final Output** module, where users can preview, download, and print the resume.
- The class diagram also represents relationships such as aggregation, association, and composition between different classes, showing the interaction and dependency among system components for efficient execution of the Online Resume Builder System.

Result

Thus, the Class Diagram for the Online Resume Builder System was designed and studied successfully. The diagram clearly represents the classes, attributes, methods, and relationships involved in user management, resume creation, template selection, PDF generation, and final resume output within the system.
